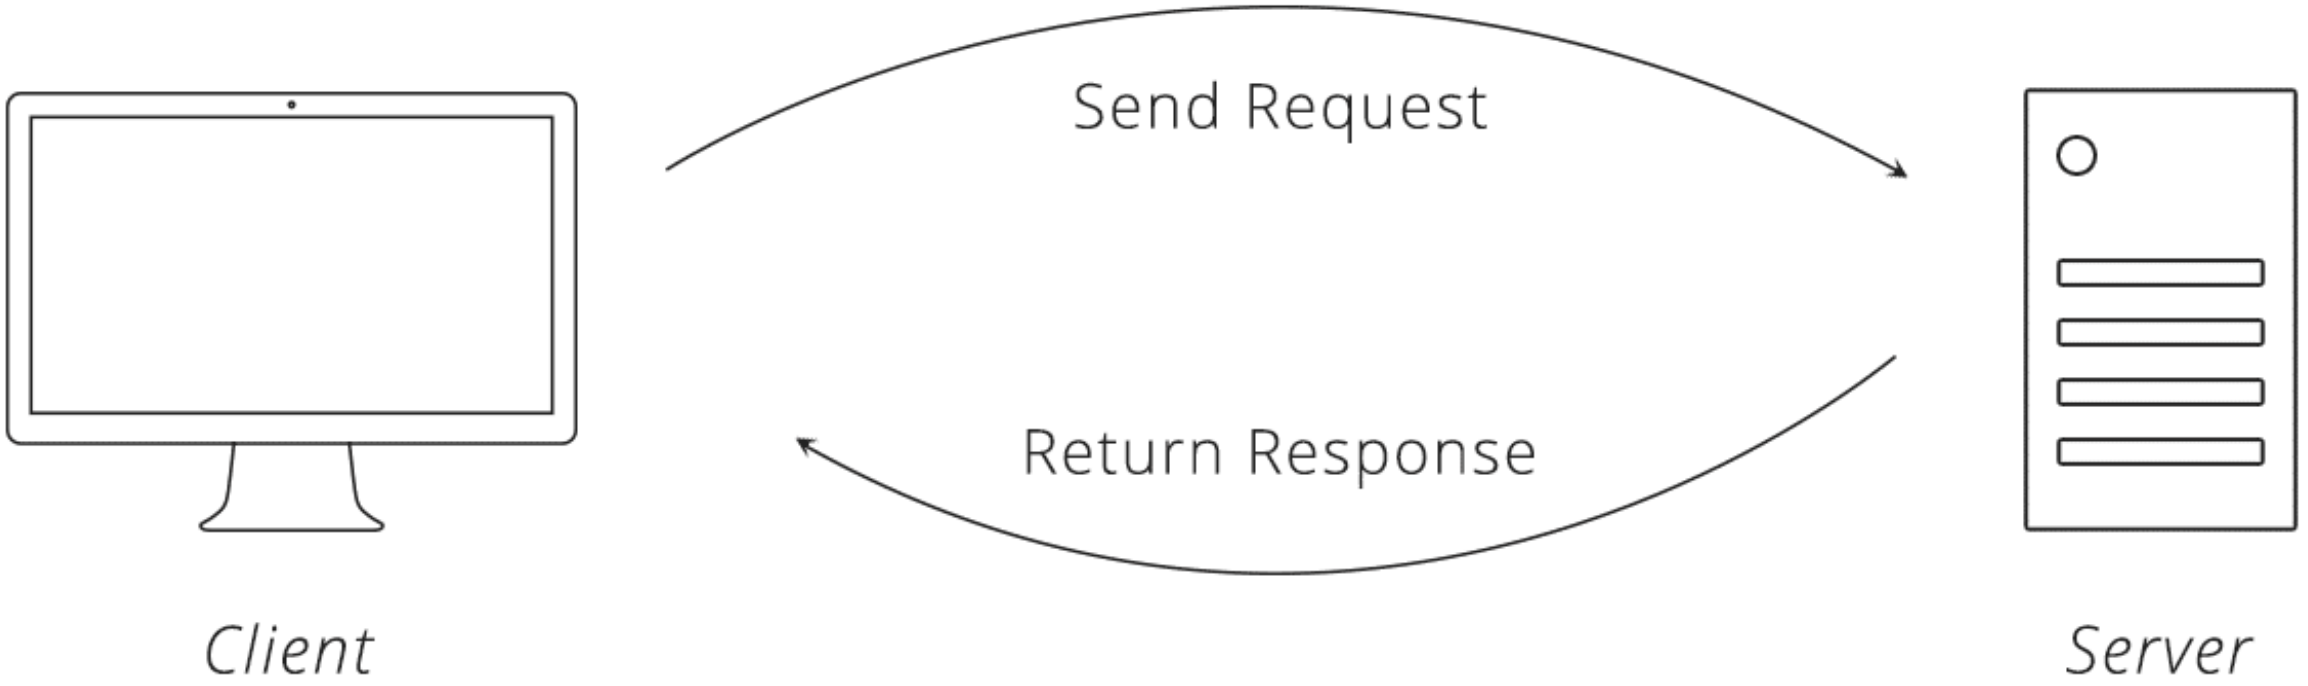
What is an API?

APIs (application programming interface) are a set of rules and mechanisms by which one application or component interacts with the others.

- Design of the Client and Server are **independent**.
- Code can be **changed at any time** without affecting the operation either.
- Improves the **flexibility** of the interface across platforms.
- Improves **scalability** by simplifying the server components.
- Each component has the ability to **evolve** independently.

Representational State Transfer (REST)



REST Communication

REST communication centers around a concept called the **Request-Response Cycle**.

Problems?

Power Automate
